                                                                                                         selected from any of more than 50000 sequences not defined in the specification. The polynucleotide sequences are useful in making cDNA, polypetides and promoter DNA, and in diagnostic, forensic, gene therapy or chromosome mapping procedures. The nucleic acid sequences are also useful for designing expression vectors and secretion vectors. This polynucleotide sequence represents a P15B4 promoter transcription binding
                                                                                                 invention relates to purified nucleic acids, which comprise sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel CYP3A5 polynucleotide useful for diagnosis and treatment of cancer, cardiovascular diseases, diabetes and AIDS, and for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a new CYPJA5 polynucleotide encoding a polypeptide, where the polynucleotide is capable of hybridising to a CYPJA5 gene. The invention is useful in an in vitro method for identifying a polymorphism. The invention is also useful for useful for diagnosing a disorder related to the presence of a molecular variant of

ö
CYP3AS or susceptibility to such a disorder, where the disorder is cancer, or diseases including cardiovascular diseases, diabetes and AIDS. The invention can further be used for the preparation of a diagnostic composition for diagnosing a disease in a subject having a genome comprising a variant allele of the CYP3AS gene, where the subject is an African American. The molecules of the invention are as forensic markers and in pharmacological studies. The present nucleic acid sequence represents a human CYP3AS gene polymorphism reference DNA sequence, as described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel dominant negative or constitutively active mutant sequence of the cardiac-associated Myo/VI protein (MP). The invention may be useful for the development of compounds with a cardiant, vasocropic, immunosuperssive or vulnerary activity through the inhibition of formation of NFkappaB p50 or NFkappaB p55 homodimers. The invention may be useful for the development of treatments for cardiovascular disease including cardiac hypertrophy, myocardial infarction, ischaemia/reperfusion injury and heart transplantation, in a mammal, for anti-ageing treatment. For inhibiting formation of NFkappaB p55 homodimers in a cell of a mammal and for reducing formation of NFkappaB p55 homodimers in a cell of a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                mutant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a signalling aptamer complex (I) for detecting a target. (I) comprises a first oligonucleotide (ON1) having a target binding domain and at least a second oligonucleotide (ON2) having a sequence complementary to a region of ON1, where in the absence of target complementary regions of ON1 and ON2 form a duplex structure, and in the presence of target the duplex dissociates and a reporter signal is generated. The signaling aptamer complex (I) can be used to detect target molecules in a sample. Aptamers comput to nucleic acid molecules, proteins, small organic compounds or entire organisms. Aptamers are easier and more cost-effective to make than other recognition molecules
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A signaling aptamer complex having a fluorophore and a quencher where fluorescent signal is quenched when the aptamer is not bound to a target molecule is useful to detect target molecules including nucleic acids and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                such as antibodies. The present sequence represents an oligonucleotide which is used in the exemplification of the present invention.

The invention discloses an isolated SOXIB polypeptides, given in the specification, and biologically active fragments having at least 6 amino acids in length, or variants having at least 85 sequence identity. Also calaimed are isolated polympucleotides encoding the polypeptides; isolated polympucleotides encoding the polypeptides; isolated polympucleotides encoding polypeptides which modulates an activity selected from cell differentiation, vasculogenesis, angiogenesis, hair follicle development; detecting a specific polypeptide or polympucleotide with a MEPZC polypeptide in a biological sample; an antigen-binding with a MEPZC polypeptide in a biological sample; an antigen-binding concerned from cell differentiation, vasculogenesis, angiogenesis and hair follicle development; a composition for treatment and/or prophylaxis of the least one condition selected from atheroaclerosis, comprising a SOXIB pulmonary disease, tissue injury and hair loss, comprising a SOXIB pulmonary disease, tissue injury and hair loss, comprising a SOXIB pulmonary disease, tissue injury and hair loss, comprising a SOXIB pulmonary disease, tissue injury and hair loss, comprising an agent that creatment and/or prophylaxis of tumourigenesis, comprising an agent that creatment and/or prophylaxis of tumourigenesis, comprising an agent that claves the level and/or functional activity of at least two subgroup F SOX polypeptides. The biologically active fragment least two subgroup F SOX polypeptides. The biologically active fragment least two subgroup F SOX polypeptides. The biologically and flow in a serial and a least B amino acids in length and comprises a SOXIB HWG domain, SOXIB trans-activation domain, SOXIB conserved C terminal domain, SOXIB conserved C terminal domain, or a portion of the domain having at least be amino acids in length and comprises a SOXIB HWG domain a secular smooth muscle cells to improve blood supply and flow in a symilar double balloon intravascular catherer mediated growth factor (FGF) I and plates in inhibitory an
                                                                                                                                                                  hair follicle development; MBF2C; atherosclerosis; cancer; restenosis; pulmonary disease; tissue injury; hair loss; tumourigenesis; subgroup P SOX; HMG domain; trans-activation domain; conserved C terminal domain; arterial wall; vascular smooth muscle; blood supply; cardiovascular disorder; ischemic heart injury; neo-vascularisation; atherosclerotic plaque; double balloon intravascular catheter; gene transfer; fibroblast growth factor. I; RGF1; platelet derived growth factor; PDGF; femoral artery; intimal hyperplasia; matrix deposition; gene therapy; cytostatic; antiarteriosclerotic; vasotropic.

This invention describes a novel in vitro method for identifying genes that are significant for hair-bearing skin, a first mixture of comprises recovering, from hair-bearing skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixtures from skin on which hair does not grow and subjecting both mixtures to serial analysis of gene expression (SAGE) to identify those genes for which expression is markedly different between the two types of skin. The invention also describes in vitro methods for determining commetic and pharmaceutical agents for use against disorders or disturbances of the homeostasis of human hair-bearing skin. A biochip and the text of the comprising a solid support (flaxible or rigid) with immobilised probes are also described for determining homeostasis. The hair-bearing skin is from the scalp and the other skin is from the face. The method allows identification of as many as possible of the genes important for hair-bearing skin, and therefore of a very wide range of potential therapeutic and cosmetic agents. AD035184-AD036518 represent the human DNA Tag fragments used to identify genes associated with hair-
                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           In vitro identification of genes important for hair-bearing skin, useful for assessing homeostasis and in screening for pharmaceutical or cosmetic agents, based on differential expression analysis.
 be used in gene therapy. The sequence presented is wild-type mouse SOX18
                                                                                                                                Gaps

This invention describes a novel in vitro method for identifying genes that are significant for hair-bearing skin in humans. The method comprises recovering, from hair-bearing skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (1.e. proteins, mRNA or their fragments), recovering a second, similar mixtures from skin on which hair does not grow and subjecting both mixtures from skin on which hair does not grow and subjecting both mixtures from skin on which hair does not grow and subjecting both mixtures from the expression is markedly different between the two types of skin. The invention also describes in vitro methods for determining from homeostasis of human hair-bearing skin and for determining activity of cosmetic and pharmaceutical agents for use against disorders or disturbances of the homeostasis of human hair-bearing skin. A biochip and test kit comprishing a solid support (flexible or rigid) with immobilised probes are also described for determining homeostasis. The hair-bearing skin is from the scalp and the other skin is from the face. The method allows identification of as many as possible of the genes important for hair-bearing skin, and therefore, of a very wide range of potential therapeutic and cosmetic agents. AD035184-AD036518 represent human DNA Tag fragments used to identify genes associated with hair-

                                                                                                                                                              RXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel in vitro method for identifying genes that are significant for facial skin in humans. The method comprises recovering, from facial skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixture from some other their fragments), recovering a second, similar mixture from some other contains the second similar mixture from some other contains and subjecting the mixtures to serial analysis of gene expression breast and subjecting the mixtures to serial analysis of gene expression (SAGE) to identify those genes for which expression is markedly different between facial skin and the other issue. The invention also describes and in vitro method for determining homeostasis of human facial skin, a test kit which comprises a solid support (flexible or rigid) on which are a block in the borobes that bind specifically to the factors of interest and a biochip for determining homeostasis of human facial skin. The products of the invention are also used in a method which determines activity of cometic and pharmaceutical agents for use against disorders or disturbances of the homeostasis of human skin and a screening method for identification of as amany as possible of the genes important for facial skin and thus of a very wide range of potential therapeutic and cosmetic agents. AD031911-AD035111 represent human DNA Tag fragments used to cometic dentify the facial skin-associated genes described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   In vitro identification of genes important for facial skin, useful for assessing homeostasis and in screening for pharmaceutical or cosmetic agents, based on differential expression analysis.
                                                                                                                                                                                                                                                                                                                facial skin; human; serial analysis of gene expression; SAGE; homeostasis; biochip; cosmetic; pharmaceutical; ds.

This invention describes a novel in vitro method for identifying genes that are significant for facial skin in humans. The method comprises cecovering, from facial skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixture from some other thman tissue, preferably skin from a protected area, especially from the breast and subjecting the mixtures to serial analysis of gene expression (SAGE) to identify those genes for which expression is markedly different between facial skin and the other tissue. The invention also describes and in vitro method for determining homeostasis of human facial skin; a test kit which comprises a solid support (flexible or rigid) on which are immobilised probes that bind specifically to the factors of interest and immobilised probes that bind specifically to the factors of interest and comment of a biochip for determining homeostasis of human facial skin. The products of the invention are also used in a method which determines activity of cosmetic and pharmaceutical agents for use against disorders or identifying cosmetic and pharmaceutical agents for use against disorders or identifying cosmetic of as many as possible of the genes important for facial skin and thus of a very wide range of potential therapeutic and cosmetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   dentify the facial skin-associated genes described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Human facial skin-associated DNA fragment SEQ ID NO 1255.

```
This invention describes a novel in vitro method for identifying genes that are significant for facial skin, in humans. The method comprises that are significant for facial skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixture from some other breast and subjecting the mixtures to serial analysis of gene expression (SAGE) to identify those genes for which expression is markedly different between facial skin and the other tissue. The invention also describes and in vitro method for determining homeostasis of human facial skin, a test in vitro method for determining homeostasis of human facial skin, a test in vitro method for determining homeostasis of human facial skin, a test impobilised probes that bind specifically to the factors of interest and in nothing for determining homeostasis of human facial skin, The products of the invention are also used in a method which determines activity of cosmetic and pharmaceutical agents for use against disorders or disturbances of the homeostasis of human skin and a screening method for identification of as many as possible of the genes important for facial skin and thus of a very wide range of potential therapeutic and cosmetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            In vitro identification of genes important for facial skin, useful for assessing homeostasis and in screening for pharmaceutical or cosmetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        igents. ADQ31911-ADQ35111 represent human DNA Tag fragments used to identify the facial skin-associated genes described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

This invention describes a novel in vitro method for identifying genes
that are significant for facial skin in humans. The method comprises
control from facial skin in humans. The method comprises
control from facial skin a first mixture of genetically expressed
control fragments), recovering a second, similar mixture from some other
than tissue, preferably skin from a protected area, especially from the
breast and subjecting the mixtures to serial analysis of gene expression
control from eathod for determining homeostasis of human facial skin, a test
the virto method for determining homeostasis of human facial skin, a test
control for determining homeostasis of human facial skin, a test
the invention are also used in a method which are a biochip for determining homeostasis of human facial skin. The products
control for determining homeostasis of human facial skin, a test
consmetic and pharmaceutical agents for use against disorders or
disturbances of the homeostasis of human skin and a screening method for
identification of as many as possible of the genes important for facial
skin and thus of a very wide range of potential therapeutic and cosmetic
control for facial shin and range of potential therapeutic and cosmetic
control for facial shin and fund and some thous in the facial skin and thus of a very wide range of potential therapeutic and cosmetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                  This invention describes a novel in vitro method for identifying genes that are significant for facial skin in humans. The method comprises recovering, from facial skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixture from some other thman tissue, preferably skin from a protected area, sepecially from the breast and subjecting the mixtures to serial analysis of gene expression breast and subjecting the mixtures to serial analysis of gene expression (SAGE) to identify those genes for which expression is markedly different between facial skin and the other tissue. The invention also describes and in vitro method for determining homeostasis of human facial skin, a test kit which comprises a solid support (flexible or rigid) on which are involved to the probes that bind specifically to the facial skin. The products of the invention are also used in a method which determines activity of commetic and pharmaceutical agents for use against disorders or disturbances of the homeostasis of human skin and a screening method for identifying cosmetic and pharmaceutical agents. The method allows confentication of as amany as possible of the genes important for facial skin and thus of a very wide range of potential therapeutic and cosmetic agents. AD031911-AD035111 represent human DNA Tag fragments used to identify the facial skin-associated genes described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

New multifunctional siNA molecule that directs cleavage of the first and second VEGF or VEGFR target sequences via RNA interference, useful in preparing a composition for treating cell proliferative disorders e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a multifunctional siNA molecule comprising a structure having Formula MF-III and which directs cleavage of the first and second VEGF or VEGFR target sequences via RNA interference. The multifunctional siNA molecule is useful in preparing a pharmaceutical composition for treating cell proliferative disorders, e.g. cancer. The present sequence represents a VEGF siRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention comprises a composition that contains an immunostimulatory nucleic acid. The immunostimulatory nucleic acid of the invention is useful for manufacturing a medicament for the treatment of an infection (e.g. viral, bacterial, fungal or parasitical), an allergic condition (e.g. allergic asthma), or cancer. The present DNA sequence represents an immunostimulatory oligonucleotide of the invention.
                                                                                                                                                                         New composition comprising an immunostimulatory nucleic acid molecule useful for manufacturing a medicament for the treatment of an infection (e.g. viral or bacterial), allergic condition (e.g. allergic asthma) or cancer.
                                                                                                          Uhlmann E, Vollmer J, Krieg AM, Noll BO;

TITLE OF INVENTION: Detection of single nucleotide polymorhphisms [SNPs] and cytosine
TITLE OF INVENTION: methylations
FILE REFERENCE: E01/1193/W0
CURRENT APPLICATION NUMBER: US/10/257,017B
CURRENT FILING DATE: 2002-10-07
                                                                                                                                                                                                                                                                                                              APPLICANT: Alexander Olek
